EXECUTIVE SUMMARY

- The use of insulation in U.S. homes and businesses saves energy, putting more money in the pockets of home and business owners. In addition, by saving energy, the use of insulation directly reduces greenhouse gas emissions.
- Beyond the benefits of the use of insulation, the insulation industry—including the manufacture, distribution, and installation of insulation—generates more than 564,000 jobs in the U.S. and \$36 billion in payrolls that support families and local communities around the country.
- Insulation materials manufacturing is a \$17.5 billion business, and directly employs more than 39,000 people across 45 states. Further downstream, more than 9,000 jobs are provided in the manufacturing of accessories and fabricated insulation panels.
- Indirectly, through its purchases of supplies, raw materials, equipment, and services, insulation manufacturing supports an additional 56,400 jobs in supply-chain industries. Through the household spending of the wages and salaries paid to workers in insulation manufacturing and their suppliers, an additional 64,000 payroll-induced jobs are supported.
- The combined direct and indirect economic activity from U.S. insulation materials manufacturing supports nearly 160,000 jobs. These jobs generate payrolls of \$9.5 billion. In addition, the combined economic activity supported by insulation materials manufacturing contributes \$1.4 billion to state and local governments and \$2.5 billion in federal tax revenues.

THE INSULATION INDUSTRY IN THE U.S.

Insulation is installed in homes and businesses around the country to keep hot things hot and cold things cold. There are various applications of insulation, including:

- **Residential insulation** - attics, walls, floors and crawl spaces, roofs, doors and windows are insulated to reduce air leaks and increase energy efficiency.
- **Nonresidential insulation** - in commercial and industrial buildings, insulation of roofs and walls (building envelope) saves on heating and cooling costs.
- **Appliances** - refrigerators, freezers, ovens, dishwashers, and hot water heaters are constructed with insulation to reduce thermal transfer.
- **Motor Vehicles** - insulation in body panels, roof, floor, trunk, hood, and door panels is used to dampen noise, heat, and sound.
- **Equipment/Mechanical** - insulating pipes, tanks, and other mechanical systems reduces energy consumption, promotes employee and public safety, minimizes environmental impacts, and contributes to the competitiveness of U.S. industry by lowering operating and production costs.

Insulation Materials

Insulation comes in many forms, depending on what is being insulated, where it is located, and other factors. Insulation is made from a variety of materials, each with a unique set of properties (i.e., R-value,¹ ability to create complex shapes, and ease of installation). The most commonly used materials in insulation products are (in alphabetical order):

- **Cellulose** - plant fibers often made from recycled newspapers, paperboard, and paper. The cellulose source is shredded and mixed with other ingredients to enhance product use and performance. It is installed as loose fill or mixed with a water to be applied in a spray.
- **Fiberglass** - a fluffy, wool-like material made from spun fibers of molten glass. The intertwined fibers of fiberglass insulation can be installed as loose fill or rolled into blankets or batts. It can also be made into board formed into shapes like pipe insulation.
- **Mineral wool** - a wool-like material made from spun fibers of molten minerals (including rock and blast furnace slag). It can be installed as loose fill, pressed into blankets, boards or batts, or formed into shapes like pipe/equipment insulation.
- **Polyisocyanurate (polyiso) foam** - a plastic foam made from the combination of several chemicals reacted to generate a closed-cell, rigid foam. It is often manufactured in boards

¹ An insulating material's resistance to conductive heat flow is measured or rated in terms of its thermal resistance or R-value -- the higher the R-value, the greater the insulating effectiveness. The R-value depends on the type of insulation, its thickness, and its density. When calculating the R-value of a multilayered installation, add the R-values of the individual layers. Installing more insulation in your home increases the R-value and the resistance to heat flow. (U.S. Department of Energy)

with a variety of facing materials or encapsulated in panels or fabricated from large buns into pipe/equipment insulation.

- **Expanded Polystyrene (EPS) Foam** - a closed-cell foam plastic, made from an expandable polystyrene resin using low global warming potential blowing agent pentane. Post-consumer and post-industrial material can be used to produce recycled content product. EPS is commonly molded in large blocks which are cut into sheets or shapes to suit various applications.
- **Extruded Polystyrene (XPS) Foam** - a cellular plastic product manufactured in a one stage process by extrusion and expansion of the base polymer in the presence of blowing agent(s) resulting in a product which is rigid with closed cellular structure, well suited for compressive strength, moisture resistance and the prevention of mold, mildew and corrosion.
- **Polyurethane foam** - a plastic foam generated by a reaction among several chemicals. For insulation, the chemicals are sprayed on site where the foaming process fills cavities and gaps. The foam can also be molded into shapes or poured into cavities to insulate appliances and other equipment.
- **Other materials** - including phenolic cellular foams, cellular glass, ceramic fiber, needled glass, elastomeric, polyethylene/polyolefin and granular materials (calcium silicate, expanded perlite, and flexible aerogel and microporous mineral materials) that are used predominantly in mechanical insulation applications.

ENVIRONMENTAL AND ECONOMIC BENEFITS OF INSULATION PRODUCTS

The insulation industry is essential to the quest for energy independence because its products help reduce energy consumption and energy-related greenhouse gas emissions. By lowering energy consumption, and thus energy bills, insulation helps make businesses more competitive and gives households more spending power. In addition, insulation reduces intrusion of outside noise, pollen and insects, allows for better humidity control, lowers the chance for ice dams in snowy climates, and promotes employee and public safety. While these benefits are enormous, they are difficult to quantify. The savings from insulation accrue to individual projects and businesses and depend on climate and the R-value (or resistance to conductive heat flow) which makes it difficult to aggregate across the economy. Some of the estimated benefits of insulation include:

- The U.S. Environmental Protection Agency's (EPA) Energy Star program estimates that by adding insulation and sealing air leaks, the average household could save 15% on heating and cooling costs.²
- In a 2009 analysis by McKinsey that examined multiple chemistry-enabled technologies to reduce emissions,³ the authors concluded "insulation alone accounted for 40% of the total identified CO₂ savings."

² https://www.energystar.gov/index.cfm?c=home_sealing.hm_improvement_methodology

³ McKinsey, "Innovations for Greenhouse Gas Reductions: A life cycle quantification of carbon abatement solutions enabled by the chemical industry." July 2009.

- According to the Department of Energy, “Space heating and cooling account for almost half of a home’s energy use, while water heating accounts for 18%, making these some of the largest energy expenses in any home.”⁴
- The heating and cooling of commercial buildings, e.g., office, retail, educational, health-care buildings and lodging, accounts for nearly 10% of all energy consumed in the U.S.⁵
- According to the Business of Council for Sustainable Energy, U.S. energy productivity grew 17.6% over the past decade.⁶ The use of insulation products across the economy is a key contribution to energy productivity growth.
- In 2009, the National Insulation Association (NIA) in collaboration with the Department of Energy’s Industrial Technologies Program and Oak Ridge National Laboratory (ORNL) documented benefits of mechanical insulation in the industrial maintenance market and examined the difference a modest increase in insulation would make in the industrial and commercial building industries. NIA estimated \$4.8 billion in energy saving and a reduction of 43 million metric tons of CO₂ emissions was possible.⁷

In addition to creating economic and environmental benefits through its use, the manufacture, distribution, and installation of insulation also generates economic activity and supports jobs in the U.S.

ECONOMIC SNAPSHOT OF THE INSULATION INDUSTRY

Table 1 - Economic Snapshot of the Insulation Industry (2019)

	Employment	Payroll (\$ billion)
Insulation Manufacturing	39,538	\$2.5
Distribution/Wholesale	47,794	\$3.4
Installation	476,928	\$30.1
Total	564,260	\$36.0

ECONOMIC CONTRIBUTIONS OF THE U.S. INSULATION INDUSTRY

The insulation manufacturing industry converts raw materials such as glass, rock, slag, chemicals, recycled paper, and other products into energy-saving insulation products. This analysis examines seven basic classes of insulation materials: polystyrene, polyurethane, polyisocyanurate (polyiso),

⁴ <https://energy.gov/energysaver/heat-and-cool>

⁵ <http://aceee.org/sector/commercial>

⁶ <https://www.bcse.org/factbook/>

⁷ <http://www.insulation.org/io/articles/mechanical-insulation-can-save-4-8-billion-in-energy-costs-and-43-million-metric-tons-of-co2-emissions-and-create-89000-green-jobs-per-year/>

fiberglass, mineral wool, cellulose, and other materials, predominantly used in mechanical insulation applications. In 45 states around the country, more than 39,000 workers are engaged in this essential economic activity. Table 2 presents the direct employment, payroll, and output associated with these main segments of insulation manufacturing. In addition to the manufacture of insulation products, the manufacture of accessories for mechanical insulation and laminated metal building insulation also create jobs and economic activity.

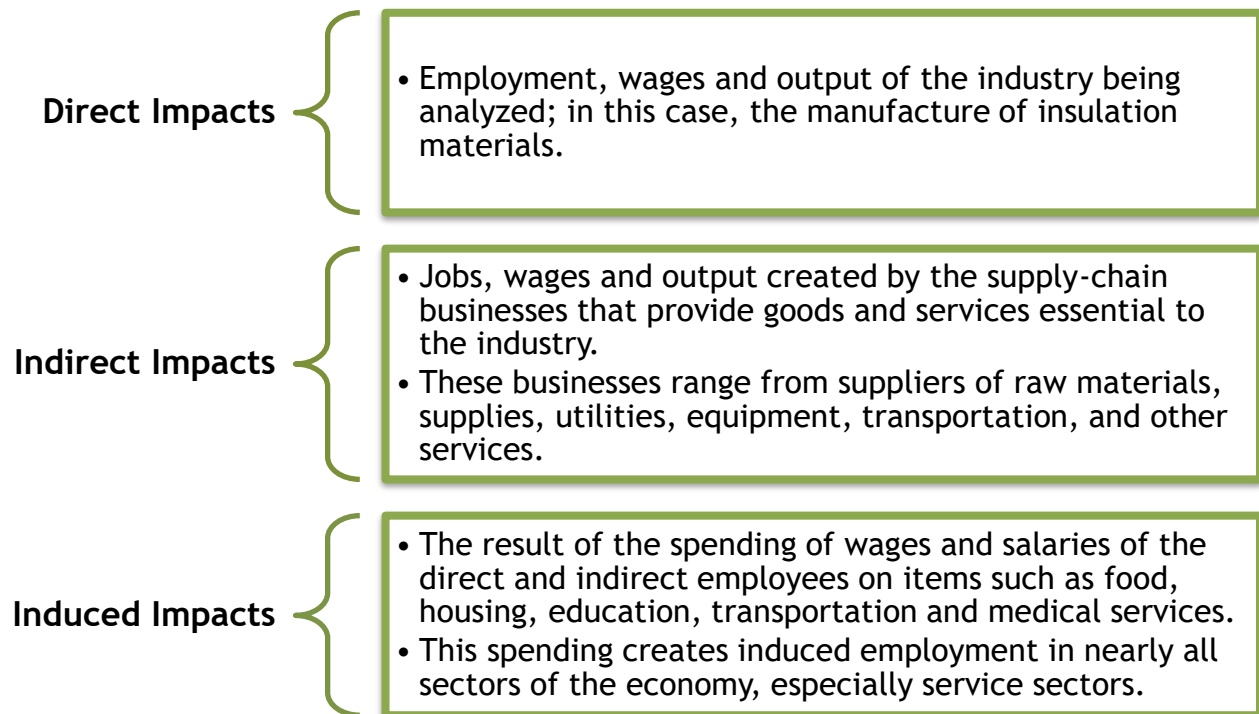

Table 2 - Insulation Materials Manufacturing (2019)

	Employment	Payroll (\$ billions)	Output (\$ billions)
Polystyrene (EPS & XPS)	4,849	\$0.3	\$2.2
Polyurethane/Polyiso	11,346	\$0.6	\$7.0
Fiberglass/Mineral wool	17,725	\$1.2	\$6.2
Cellulose	1,155	\$0.1	\$0.4
Other*	4,463	\$0.3	\$1.8
Total Manufacturing	39,538	\$2.5	\$17.5
<i>Addenda</i>			
<i>Accessories for Mechanical Insulation Systems</i>	5,069	\$0.4	\$0.8
<i>Laminated Metal Building Insulation</i>	2,972	\$0.2	\$0.5
<i>Structural Insulated Panels</i>	1,050	\$0.1	\$0.1

* includes materials not listed above that are used predominantly in mechanical insulation applications, including phenolic cellular foams, cellular glass, ceramic fiber, needled glass, elastomeric, polyethylene/polyolefin and granular materials (calcium silicate, expanded perlite, and flexible aerogel and microporous mineral materials).

The value and contributions of insulation manufacturing do not just accrue to the manufacturers. Economic activity is supported both upstream (through supply chain impacts) and downstream as manufactured insulation products move through distribution/wholesale channels to the contractors whose business includes installing insulation.

Upstream Economic Impact

The economic contributions of the insulation manufacturing were analyzed using an economic input-output model, IMPLAN.⁸ This method estimates the total contributions of an industry to the economy at the state and national levels for a given year. The economic contributions analyzed in this report are employment, payroll and output in the U.S. for the year 2019.

The manufacture of insulation materials directly generates \$17.5 billion in industry shipments and directly employs more than 39,500 workers across 45 states. Insulation manufacturers purchase goods and services from their suppliers and their suppliers do the same. The economic impact generated by the insulation supply chain supports an additional 56,400 indirect jobs. Finally, the wages paid by insulation manufacturers and their suppliers support more than 64,000 payroll-induced jobs, jobs supported by the household spending of workers in the direct and indirect (supply-chain) segments. Thus, the economic activity from U.S. insulation manufacturing supports nearly 160,000 jobs which generate payrolls of \$9.5 billion.

In addition, the combined economic activity supported by insulation manufacturing contributes \$1.4 billion to state and local governments and \$2.5 billion in federal tax revenues.

⁸ IMPLAN (IMpact analysis for PLANning) is a complete economic assessment package providing economic resolution from the National level down to the zip code level; MIG Inc. is the sole licensor of IMPLAN.

Table 3 - Upstream Economic Impact of Insulation Manufacturing (2019)

	Employment	Payroll (\$ billions)	Output (\$ billions)
Direct Impact (Manufacturers)	39,538	\$2.5	\$17.5
Indirect Impact (Supply Chain)	56,435	\$4.0	\$19.5
Payroll-Induced Impact	63,950	\$3.0	\$11.7
Total Impact	159,922	\$9.5	\$48.8

Downstream Economic Impact

Looking downstream, nearly 48,000 wholesalers distribute insulation products to contractors/ installers and retailers around the country and nearly 477,000 workers are engaged in the drywall and insulation installation, nonresidential roofing, and mechanical insulation installation. Payrolls in those sectors amount to \$3.4 billion and \$30.1 billion, respectively. The paychecks from these workers help support families and local economies throughout the U.S.

Table 4 - Downstream Employment and Payrolls (2019)

	Employment	Payroll (\$ billions)
<u>Distribution/Wholesale</u>		
Roofing, Siding, and Insulation Wholesalers	39,058	\$2.8
Mechanical Insulation Distributors	8,736	\$0.6
Total Distribution/Wholesale	47,794	\$3.4
<u>Installation/Contractors</u>		
Drywall & Insulation Contractors	258,986	\$14.7
Roofing Contractors - Nonresidential	112,054	\$6.7
Mechanical Contractors	105,888	\$8.7
Total Installation/Contractors	476,928	\$30.1

CONCLUSION

The insulation industry, including manufacturers, distributors, and installers, makes vital contributions to the U.S. economy. The products that they make, distribute, and install conserve precious energy resources, saving money for households and businesses. The use of insulation also has large environmental benefits, as reduced energy consumption translates directly into lower emissions of greenhouse gases. In addition, through supply chain and payroll-induced impacts, the economic activity generated by American insulation manufacturing is broad and helps support local economies across the U.S. Moving through the economy, there are huge contributions in terms of jobs and payrolls generated by those businesses that distribute insulation products from manufacturers to where they will be installed. Finally, hundreds of thousands of workers make a living installing insulation in homes and businesses around the U.S.

APPENDIX - INSULATION JOBS IN THE STATES

Insulation manufacturing occurs in 45 states while distribution/wholesale and installation activities occur across all 50 states. Appendix Table 1 presents the top 10 states in each of the three main segments. Appendix Table 2 presents employment by segment for all states.

Appendix Table 1 - Top 10 States for Insulation Employment by Industry Segment (2019)

Manufacturing		Distribution/Wholesale		Installation/Contractors

NOTES ON METHODOLOGY AND SOURCES

Data on direct employment and payrolls are based on data from the Bureau of Labor Statistics (Covered Employment and Wages program). In addition, for insulation manufacturing, employment estimates were also based on results from a January 2017 survey of insulation manufacturers. Survey results for some segments were updated in August 2020. Payrolls were estimated using average annual pay for industries and states multiplied by the employment estimates.

For insulation manufacturing, where data on shipments was estimated as a portion of a larger NAICS code, employment was estimated using output-to-employment ratios for that particular NAICS code supplemented with data from the survey of insulation manufactures. Employment data on mechanical insulation manufacturers was provided by the National Insulation Association (NIA). Payrolls for each segment were estimated by multiplying employment by the average annual wage for that industry.

With the exception of fiberglass/mineral wool insulation manufacturing, insulation made from other materials falls within broader NAICS codes and is not easily pulled out of existing government data. As a result, data on shipments/output of manufactured insulation products was derived from multiple sources, including the Census Bureau, IHS Chemical, the Center for the Polyurethanes Industry, Polyisocyanurate Insulation Manufacturers Association (PIMA), Cellulosic Insulation Manufacturers Association (CIMA), EPS Industry Alliance, Extruded Polystyrene Foam Association, Structural Insulated Panel Association (SIPA) and NIA.

Data on employment and payroll for distributors/wholesalers is based on NAICS 42333 (Roofing, Siding, and Insulation Wholesalers). In addition, data for distributors of mechanical insulation were provided by the NIA.

Data on employment and payroll for installers and contractors is based on the following NAICS codes in addition to data from NIA on mechanical insulation installers:

NAICS 23831 - Drywall & insulation contractors (residential & nonresidential)

NAICS 238162 - Nonresidential roofing contractors

It was determined that these NAICS classifications represent a large share of the insulation installation segment. Drywall installation is included in NAICS 238311 and 238312. While no data exists to separate insulation contractors from drywall contractors, it is likely that a majority of these contractors are engaged in both lines of business. In addition, it should be noted that insulation is also installed by self-employed handymen and homeowners that are not included in industry employment data. Because roofs are a significant source of energy losses in commercial buildings, most roofing contractors are also engaged in insulation installment as part of a commercial roofing project. Though likely significant, installers of insulation in appliances, industrial equipment, mechanical systems, transportation equipment, etc. are not included due to a lack of data.

ECONOMICS AND STATISTICS DEPARTMENT

The Economics & Statistics Department provides a full range of statistical and economic advice and services for ACC and its members and other partners. The group works to improve overall ACC advocacy impact by providing statistics on American Chemistry as well as preparing information about the economic value and contributions of American Chemistry to our economy and society. They function as an in-house consultant, providing survey, economic analysis and other statistical expertise, as well as monitoring business conditions and changing industry dynamics. The group also offers extensive industry knowledge, a network of leading academic organizations and think tanks, and a dedication to making analysis relevant and comprehensible to a wide audience. The primary author of this report is Martha Gilchrist Moore.
