

Working Safely with **ISOCYANATE-BASED SPRAY-ON LININGS**

Polyurethane and polyurea spray-on linings are used in a variety of ways to protect products and surfaces from excessive wear and damage.

These liner systems are made by combining an isocyanate with a polyol resin blend that may contain a mixture of several chemical ingredients. These materials require careful use and attention to following defined precautions and procedures in order to minimize exposure risk.

This program provides general guidance on how to safely apply spray-on lining systems. It is intended for professional applications and is a supplement to existing job safety information and training provided by your employer.

This DVD explores the following topics:

- Overview of Working with Isocyanates
- Potential Effects of Overexposure
- Overview of Spray Enclosures
- Personal Protective Equipment
- Inspection of Use of Respirators
- Typical Spray-on Application

Total Running Time: 17:20
